

IoT-Based Health Monitoring System

Usman Rasheed Siddiqui

September 7, 2026

1 Introduction

An IoT-based Health Monitoring System is used to monitor a person's health using sensors and IoT technology. The system collects health data and sends it to a monitoring application.

2 Basic Functionality

The system uses sensors to collect health information such as:

- Heart rate
- Body temperature
- Blood oxygen level

The sensors send the collected data to a microcontroller. The microcontroller sends the data through the Internet to a server. The user or doctor can then view the health information through a web or mobile application.

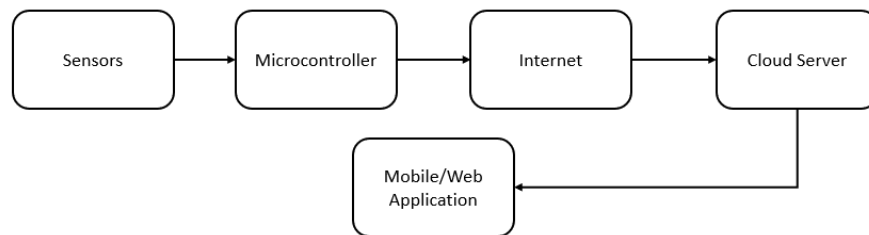

3 System Components

The main components of the system are:

1. Health sensors
2. Microcontroller
3. Internet connection
4. Cloud server
5. Web or mobile application

4 Block Diagram

The basic working of the system can be represented as:

5 Conclusion

The IoT-based Health Monitoring System allows health data to be collected and monitored remotely. It can help users and doctors observe important health information easily.
